Model Checking

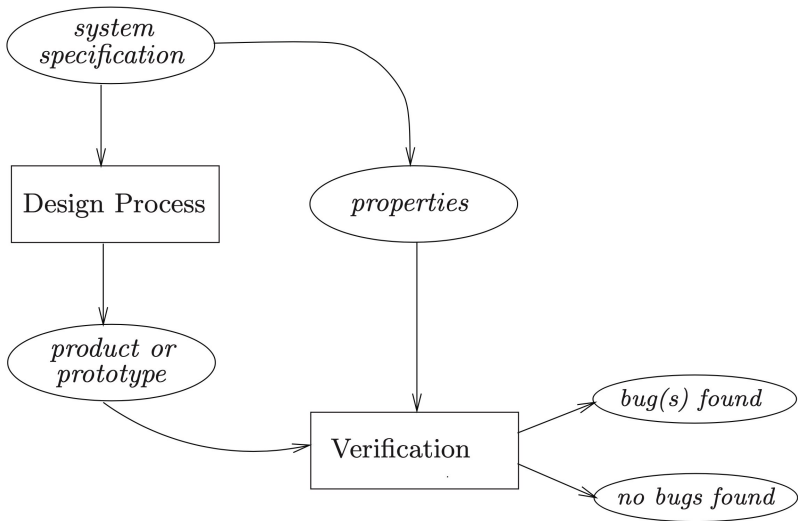

... is an effective automatable technique:

- ▶ *to expose potential software design errors;*
- ▶ *that, given a finite-state model of a system and a formal property, systematically checks whether this property holds for that model.*

Strengths:

- ▶ widely applicable
(embedded systems, software engineering, hardware design)
- ▶ supports **partial verification** (of modules)
- ▶ provides **diagnostic information** for debugging
- ▶ has sound **mathematical underpinning** (logic and process theory)

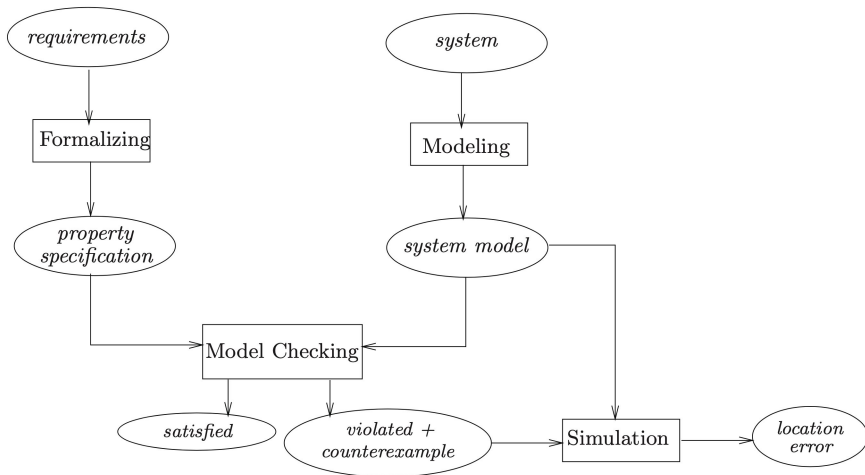

Hard-/Software Verification (traditionally)

Error introduction, detection, and repair costs

Model checking

Example: concurrency and non-determinism

Programs `Inc`, `Dec`, and `Reset` cooperate, and use a shared variable `x`:

proc `Inc`

while true

do

if `x` < 200

then `x` := `x` + 1

fi

od

proc `Dec`

while true

do

if `x` > 0

then `x` := `x` - 1

fi

od

proc `Reset`

while true

do

if `x` = 200

then `x` := 0

Question: Is $0 \leq x \leq 200$ always guaranteed?

Modeling (by labeled transition systems)

proc Inc

while true

do

if $x < 200$

then $x := x + 1$

fi

od

proc Dec

while true

do

if $x > 0$

then $x := x - 1$

proc Reset

while true

do

if $x = 200$

then $x := 0$

Model checking

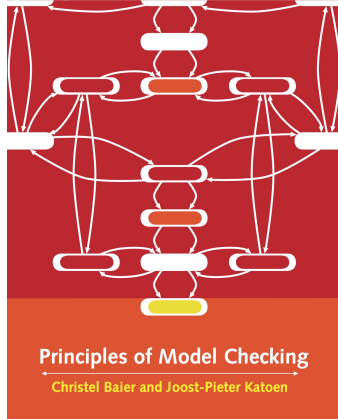

Any [such] verification is only as good as the model of the system.

Course topics

- ▶ modeling systems by **labeled transition systems (LTSs)**
- ▶ **linear time behaviour properties** (based on execution traces)
- ▶ concepts of **fairness**
- ▶ **Linear Temporal Logic (LTL)**
 - ▶ model checking
 - ▶ express properties by **Büchi automata**
 - ▶ model check LTSs and properties via **product automata**
- ▶ **Computation Tree Logic (CTL)** and variants (**CTL⁺**, **CTL^{*}**)
- ▶ Partial model checking
 - ▶ for partially unknown systems (state properties/states/transitions)
- ▶ analysing system behavior with **mCRL2**
