Meta-theorems: idea, benefits and limitations

idea:

- ▶ express a problem P by a logical formula φ_P (of 'short' size)
- ▶ use **model checking** of φ_P
on logical structures of **bounded width k** (tree-, clique-width, ...)
 - ▶ is time bounded depending on k , size of φ_P , size of the structure
 - ▶ this often facilitates FPT-results

First-order logic: semantics (structures)

Definition

Let $\tau = \{R_1, \dots, R_n\}$ be a vocabulary.

A τ -*structure* is a tuple $\mathcal{A} = \langle A; R_1^{\mathcal{A}}, \dots, R_n^{\mathcal{A}} \rangle$ consisting of:

- ▶ the *universe* A ,
- ▶ *interpretations* $R_i^{\mathcal{A}} \subseteq A^{ar(R_i)} = \overbrace{A \times \dots \times A}^{ar(R_i)}$ for each of the relation symbols R_i in τ , where $i \in \{1, \dots, n\}$.

Examples

Let $\tau_G = \{E/2\}$ vocabulary with binary edge relation.

The *standard structure* for a graph $\mathcal{G} = \langle V, E \rangle$:

$$\mathcal{A}_{\tau_G}(\mathcal{G}) := \langle V; E^{\text{symm}} \rangle.$$

Tree decompositions, and tree-width for graphs

Definition (recalling tree-width for graphs)

A **tree decomposition** of a graph $\mathcal{G} = \langle V, E \rangle$ is a pair $\langle \mathcal{T}, \{B_t\}_{t \in T} \rangle$ where $\mathcal{T} = \langle T, F \rangle$ a (undirected, unrooted) tree, and $B_t \subseteq V$ for all $t \in T$ such that:

- (T1) $A = \bigcup_{t \in T} B_t$ (every vertex of \mathcal{G} is in some bag).
- (T2) $(\forall \{u, v\} \in E) (\exists t \in T) [\{u, v\} \subseteq B_t]$
(the vertices of **every edge** of \mathcal{G} are realized in some bag).
- (T3) $(\forall v \in V) [\text{subgraph of } \mathcal{T} \text{ defd. by } \{t \in T \mid v \in B_t\} \text{ is connected}]$
(the tree vertices (in \mathcal{T}) whose bags contain some vertex of \mathcal{G} induce a subgraph of \mathcal{T} that is connected).

The **width** of a tree dec. $\langle \mathcal{T}, \{B_t\}_{t \in T} \rangle$ is $\max \{|B_t| - 1 \mid t \in T\}$.

The **tree-width** $tw(\mathcal{A})$ of a τ -structure \mathcal{A} is defined by:

$tw(\mathcal{A}) :=$ minimal width of a tree decomposition of \mathcal{A} .

For all parameterized problems $\langle Q, \kappa_1 \rangle$ and $\langle Q, \kappa_2 \rangle$ with parameterizations $\kappa_1, \kappa_2 : \Sigma^* \rightarrow \mathbb{N}$ with $\kappa_1 \geq \kappa_2$:

$$\langle Q, \kappa_1 \rangle \in \text{FPT} \iff \langle Q, \kappa_2 \rangle \in \text{FPT}$$

$$\langle Q, \kappa_1 \rangle \notin \text{FPT} \implies \langle Q, \kappa_2 \rangle \notin \text{FPT}$$

Courcelle's Theorem for clique-width

Recall that $\text{MSO}(\tau_G) \sim \text{MSO}_1$ (quantification over sets of vertices, but not sets of edges).

p^* - $\text{clw-MC}(\text{MSO}(\tau_G)/\text{MSO}_1)$

Instance: A graph \mathcal{G} and an $\text{MSO}(\tau_G)$ -sentence φ .

Parameter: $\text{clw}(\mathcal{G}) + |\varphi|$.

Problem: Decide whether $\mathcal{A}(\mathcal{G}) \models \varphi$.

Theorem ([Courcelle et al., 2000])

p^* - $\text{clw-MC}(\text{MSO}(\tau_G)/\text{MSO}_1) \in \text{FPT}$.

Also, there is a **maximization version** of this theorem.

Courcelle's Theorem for clique-width (example)

Let $\mathcal{G} = \langle V, E \rangle$ a graph. For all $S \subseteq V$:

S is a **vertex cover** of $\mathcal{G} : \iff \forall e = \{u, v\} \in E (u \in S \vee v \in S)$

p^* -**clw**-VERTEX-COVER

Instance: A graph $\mathcal{G} = \langle V, E \rangle$, and $\ell \in \mathbb{N}$.

Instance: **clw**(\mathcal{G}).

Problem: Does \mathcal{G} have a vertex cover of size at most ℓ ?

Example

p^* -**clw**-VERTEX-COVER \in **FPT**.

We saw that there is a **MSO**₂ formula $\varphi(X)$ such that:

$$\mathcal{A}_{\text{THG}}(\mathcal{G}) \models \varphi(S) \iff S \subseteq E \text{ is an 2-colorable set of edges in } \mathcal{G}$$

But there seems not to be such an **MSO**₁ formula.
