Meta-theorems: idea, benefits and limitations

idea:

- express a problem P by a logical formula φ_P (of 'short' size)
- use model checking of φ_P
  on logical structures of bounded width k (tree-, clique-width, ...)
  - is time bounded depending on k, size of φ_P, size of the structure
  - this often facilitates FPT-results

benefits:

- a quick and easy way to show
  that [some problems] are fixed-parameter tractable,
- without working out the tedious details
  of a dynamic programming algorithm.

First-order logic: semantics (structures)

Definition

Let $\tau = \{R_1, \ldots, R_n\}$ be a vocabulary.
A *τ-structure* is a tuple $\mathcal{A} = \langle A; R_1^{\mathcal{A}}, \ldots R_n^{\mathcal{A}} \rangle$ consisting of:

- the *universe* A,
- *interpretations* ${R_i}^{\mathcal{A}} \subseteq A^{ar(R_i)} = \overbrace{A \times \ldots \times A}^{ar(R_i)}$ for each of the relation symbols R_i in τ, where $i \in \{1, \ldots, n\}$.

Examples

Let $\tau_{\mathsf{G}} = \{E/_2\}$ vocabulary with binary edge relation.
The *standard structure* for a graph $\mathcal{G} = \langle V, E \rangle$:

$$\mathcal{A}_{\tau_{\mathsf{G}}}(\mathcal{G}) := \langle V; E^{\mathsf{symm}} \rangle \,.$$

Tree decompositions, and tree-width for graphs

Definition (recalling tree-width for graphs)

A *tree decomposition* of a graph $\mathcal{G} = \langle V, E \rangle$
is a pair $\langle \mathcal{T}, \{B_t\}_{t \in T} \rangle$ where $\mathcal{T} = \langle T, F \rangle$ a (undirected, unrooted) tree,
and $B_t \subseteq V$ for all $t \in T$ such that:

(T1) $A = \bigcup_{t \in T} B_t$ (every vertex of $\mathcal{G}$ is in some bag).

(T2) $(\forall a \in A) \big[\{t \in T \mid a \in B_t\}$ is connected subtree of $\mathcal{T} \big]$
(the vertices whose bags contain some vertex of $\mathcal{G}$
form a connected subtree of $\mathcal{T}$).

(T3) $(\forall \{u, v\} \in E) (\exists t \in T) \big[\{u, v\} \subseteq B_t \big]$
(the vertices of every edge of $\mathcal{G}$ are realized in some bag).

The *width* of a tree dec. $\langle \mathcal{T}, \{B_t\}_{t \in T} \rangle$ is $\max \{ |B_t| - 1 \mid t \in T \}$.

Comparing parameterizations

Definition (computably bounded below)

Let $\kappa_1, \kappa_2 : \Sigma^* \to \mathbb{N}$ parameterizations.

- $\kappa_1 \succeq \kappa_2 \;:\Longleftrightarrow\; \exists g : \mathbb{N} \to \mathbb{N}$ computable $\forall x \in \Sigma^* \big[\, g(\kappa_1(x)) \geq \kappa_2(x) \,\big]$.
- $\kappa_1 \approx \kappa_2 \;:\Longleftrightarrow\; \kappa_1 \succeq \kappa_2 \;\wedge\; \kappa_2 \succeq \kappa_1$.
- $\kappa_1 \succ \kappa_2 \;:\Longleftrightarrow\; \kappa_1 \succeq \kappa_2 \;\wedge\; \neg(\kappa_2 \succeq \kappa_1)$.

Proposition

For all parameterized problems $\langle Q, \kappa_1 \rangle$ and $\langle Q, \kappa_2 \rangle$ with parameterizations $\kappa_1, \kappa_2 : \Sigma^* \to \mathbb{N}$ with $\kappa_1 \succeq \kappa_2$:

$$\begin{array}{ccc} \langle Q, \kappa_1 \rangle \in \mathrm{FPT} & \Longleftarrow & \langle Q, \kappa_2 \rangle \in \mathrm{FPT} \\ \langle Q, \kappa_1 \rangle \notin \mathrm{FPT} & \Longrightarrow & \langle Q, \kappa_2 \rangle \notin \mathrm{FPT} \end{array}$$

Courcelle's Theorem for clique-width

Recall that $\mathrm{MSO}(\tau_{\mathrm{G}}) \sim \mathrm{MSO}_1$ (quantification over sets of vertices, but not sets of edges).

> p^*-*clw*-MC($\mathrm{MSO}(\tau_{\mathrm{G}})/\mathrm{MSO}_1$)
> **Instance:** A graph $\mathcal{G}$ and an $\mathrm{MSO}(\tau_{\mathrm{G}})$-sentence φ.
> **Parameter:** $\mathit{clw}(\mathcal{G}) + |\varphi|$.
> **Problem:** Decide whether $\mathcal{A}(\mathcal{G}) \vDash \varphi$.

Theorem ([Courcelle et al., 2000])

p^*-*clw*-MC($\mathrm{MSO}(\tau_{\mathrm{G}})/\mathrm{MSO}_1$) $\in$ FPT.

Also, there is a maximization version of this theorem.

Courcelle's Theorem for clique-width (example)

Let $\mathcal{G} = \langle V, E \rangle$ a graph. For all $S \subseteq V$:

We saw that there is a MSO_2 formula $\varphi(X)$ such that:

$$\mathcal{A}_{\tau_{\text{HG}}}(\mathcal{G}) \vDash \varphi(S) \iff S \subseteq E \text{ is an 2-colorable set of edges in } \mathcal{G}$$
