# Post's Correspondence Problem

#### Emil Leon Post:

- article:
  - "A Variant of a Recursively Unsolvable Problem"
     Bulletin of the American Mathematical Society, 1946.

# Comparing computational power via encodings

Simulation of functions: function f<sub>2</sub> simulates function f<sub>1</sub> via encoding ρ if:

▶ Simulation of models of computation  $\mathcal{M}_1 = \langle D_1, \mathcal{F}_1 \rangle$ ,  $\mathcal{M}_2 = \langle D_2, \mathcal{F}_2 \rangle$ :  $\mathcal{M}_2$  can simulate  $\mathcal{M}_1$  via  $\rho$  ( $\mathcal{M}_1 \lesssim_{\rho} \mathcal{M}_2$ ), if:

$$\forall f_1 \in \mathcal{F}_1 \ \exists f_2 \in \mathcal{F}_2 \ (f_2 \ \text{simulates} \ f_1 \ \text{via} \ \rho)$$

# Weak requirements on encodings (Boker/Dershowitz)

Traditional requirements on encodings are:

- ▶ informally computable/effective/mechanizable in principle
- computable with respect to a specific model (Turing machine, ...)

Boker & Dershowitz [1]: want a 'robust definition that does not itself depend on the notion of computability', and therefore suggest as encodings:

- (i) *injective* functions
- (ii) bijective functions

Definition (power subsumption pre-order [Boker/Dershowitz 2006 [1]])

- (i)  $\mathcal{M}_1 \lesssim \mathcal{M}_2$  if: there is an injective  $\rho$  such that  $\mathcal{M}_1 \lesssim_{\rho} \mathcal{M}_2$
- (ii)  $\mathcal{M}_1 \lesssim_{\text{bijective}} \mathcal{M}_2$  if: there is a bijective  $\rho$  such that  $\mathcal{M}_1 \lesssim_{\rho} \mathcal{M}_2$

### Anomalies for decision models

However, we found anomalies of these definitions.

$$\mathcal{M} = \langle D, \mathcal{F} \rangle$$
 is a decision model if  $\{0, 1\} \subseteq D$ ,  $\forall f \in \mathcal{F} (f[D] \subseteq \{0, 1\})$ .

Theorem (Endrullis/G/Hendriks, [3])

Let  $\Sigma$  and  $\Gamma$  with  $\{0,1\} \subseteq \Sigma$ ,  $\Gamma$  be alphabets.

Then for every countable decision model  $\mathcal{M} = \langle \Sigma^*, \mathcal{F} \rangle$ , it holds:

$$\mathcal{M} \lesssim \mathsf{DFA}(\Gamma)$$
  $\mathcal{M} \lesssim_{\mathsf{bijective}} \mathsf{DFA}(\Gamma)$ 

 $\mathsf{TMD}(\Sigma)$ : class of Turing machine deciders with input alphabet  $\Sigma$ 

Anomaly (example)

$$\mathsf{TMD}(\Sigma) \lesssim_{\mathsf{bijective}} \mathsf{DFA}(\Gamma)$$

These anomalies for decision models and bijective encodings:

- depend on uncomputable encodings
- can be extended to some moc's with unbounded output domain
- but do not extend to all moc's

# Simulations between models of computation

models  $M_1 \in \mathcal{M}_1$  and  $M_2 \in \mathcal{M}_2$  simulate each other with respect to computable coding  $\cdot \cdot : I_{\mathcal{M}_1} \to I_{\mathcal{M}_2}$  and decoding  $\cdot \cdot : O_{\mathcal{M}_2} \to O_{\mathcal{M}_1}$  if:

$$x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_1} \qquad \qquad x_2 \in I_{\mathcal{M}_2} \qquad \qquad x_1 \in I_{\mathcal{M}_2} \qquad \qquad x_2 \in I$$

(defines a Galois connection)

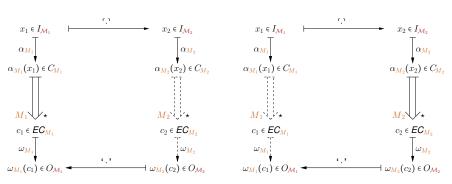

## Models of computation, viewed abstractly

A(n abstractly viewed) model of computation (MoC) is a class  $\mathcal{M}$  of machines/systems/... such that every  $M \in \mathcal{M}$  it holds:

- $\triangleright$  *M* has a countable set  $I_{\mathcal{M}}$  of input objects, and a countable set  $O_{\mathcal{M}}$  of output objects that are specific to the MoC  $\mathcal{M}$ ;
- $\triangleright$  *M* has a set  $C_M$  of configurations of *M*, which contains the subset  $EC_M \subseteq C_M$  of end-configurations of *M*;
- $\triangleright$  *M* has an injective input function  $\alpha_M : I_M \to C_M$ , which maps input objects of *M* to configurations of *M*;  $\alpha_M$  is computable;
- $\triangleright$  *M* defines a one-step computation relation  $\mapsto_M$  on the set  $C_M$ ; the transitive closure of  $\mapsto_M$  is designated by  $\mapsto_M^*$ ;
- ightharpoonup M has a partial output function  $\omega_M : EC_M 
  ightharpoonup O_M$ , which maps some end-configurations of M to output objects of M;  $\omega_M$  is computable, and membership of end-configurations in  $dom(\omega_M)$  is decidable.

# Simulations between models of computation

models  $M_1 \in \mathcal{M}_1$  and  $M_2 \in \mathcal{M}_2$  simulate each other with respect to coding  $\cdot \cdot : I_{\mathcal{M}_1} \to I_{\mathcal{M}_2}$  and decoding  $\cdot \cdot : O_{\mathcal{M}_2} \to O_{\mathcal{M}_1}$  if:

(defines a Galois connection)

## Comparing Computational Power of MoC's

#### Definition

Let  $\mathcal{M}_1$  and  $\mathcal{M}_2$  be MoC's.

**1** The computational power of  $\mathcal{M}_1$  is subsumed by that of  $\mathcal{M}_2$ , denoted symbolically by  $\mathcal{M}_1 \leq \mathcal{M}_2$ , if:

2 The computational power of  $\mathcal{M}_1$  is equivalent to that of  $\mathcal{M}_2$ , denoted by  $\mathcal{M}_1 \sim \mathcal{M}_2$ , if both  $\mathcal{M}_1 \leq \mathcal{M}_2$  and  $\mathcal{M}_2 \leq \mathcal{M}_1$  hold.

# Comparing Computational Power of MoC's

#### **Theorem**

For all models  $\mathcal{M}_1$  and  $\mathcal{M}_2$ , and encoding and decoding functions  $: I_{\mathcal{M}_1} \to I_{\mathcal{M}_2}$  and  $: : O_{\mathcal{M}_2} \to O_{\mathcal{M}_1}$  it holds:

$$\mathcal{M}_1 \leq_{(',',',')} \mathcal{M}_2 \implies \mathcal{F}(\mathcal{M}_1) \subseteq \{'\cdot '\circ f \circ '\cdot ' \mid f \in \mathcal{F}(\mathcal{M}_2)\}.$$

## Turing completeness and equivalence

By  $\mathcal{TM}(\Sigma)$  we mean the model of Turing machines over input alphabet  $\Sigma$ .

#### Definition

Let  $\mathcal{M}$  a model of computation.

 $\mathcal{M}$  is Turing-complete if  $\mathcal{TM}(\Sigma) \leq \mathcal{M}$  for some alphabet  $\Sigma$  with  $\Sigma \neq \emptyset$ .

 $\mathcal{M}$  is Turing-equivalent if  $\mathcal{M} \sim \mathcal{TM}(\Sigma)$  for some alphabet  $\Sigma \neq \emptyset$ .

### Interaction Nets

#### Yves Lafont (1990) [4] (link pdf) proposed:

a programming language with a simple graph rewriting semantics

### An interaction net is specified by:

- a set of agents
- a set of interaction rules

### Analogy with:

- electric circuits:
  - ▶ agents <sup>≙</sup> gates,
  - ▶ edges <sup>≙</sup> wires
- agents as computation entities:
  - interaction rules specify behavior
