Church's Thesis

Alonzo Church (1903 –1995)

Thesis (Church, 1936)

- Every total effectively calculable function is recursive.
- Every effectively calculable partial function is partial-recursive.

λ -terms

Definition

- ▶ variables: $x, y, z, x_1, y_1, z_1, \ldots \in \Lambda$
- ▶ λ -abstraction: x a variable, $M \in \Lambda \implies (\lambda x. M \in \Lambda)$
- ▶ application: $M, N \in \Lambda \implies (MN) \in \Lambda$

β -reduction

Definition

▶ One-step β -reduction \rightarrow_{β} is defined as the application of the rule:

$$(\lambda x.M)N \rightarrow_{\beta} M[x = N]$$

in λ -terms $C[(\lambda x.M)N]$ formed by arbitrary λ -term contexts C[], where is $\lambda x.MN$ called a redex, and furthermore:

M[x := N] := substitution of N for free occurrences of x in M (using α -conversion to avoid variable capture)

β -reduction

Definition

▶ One-step β -reduction \rightarrow_{β} is defined as the application of the rule:

$$(\lambda x.M)N \rightarrow_{\beta} M[x \coloneqq N]$$

in λ -terms $C[(\lambda x.M)N]$ formed by arbitrary λ -term contexts C[], where is $\lambda x.MN$ called a redex, and furthermore:

M[x := N] := substitution of N for free occurrences of x in M (using α -conversion to avoid variable capture)

► Many-step β -reduction \Rightarrow_{β} is defined as the concatenation of zero, one, or more \Rightarrow_{β} -steps.

β -reduction

Definition

▶ One-step β -reduction \rightarrow_{β} is defined as the application of the rule:

$$(\lambda x.M)N \rightarrow_{\beta} M[x = N]$$

in λ -terms $C[(\lambda x.M)N]$ formed by arbitrary λ -term contexts C[], where is $\lambda x.MN$ called a redex, and furthermore:

M[x := N] := substitution of N for free occurrences of x in M (using α -conversion to avoid variable capture)

- ► Many-step β -reduction \Rightarrow_{β} is defined as the concatenation of zero, one, or more \Rightarrow_{β} -steps.
- \blacktriangleright A λ -term M is a normal form if it does not contain a redex.

Church numerals

Definition

For every $n \in \mathbb{N}$, the Church numeral $\lceil n \rceil$ for n is defined by:

$$\lceil n \rceil := \lambda f x. f^n x$$

Church numerals

Definition

For every $n \in \mathbb{N}$, the Church numeral $\lceil n \rceil$ for n is defined by:

$$[n] := \lambda f x. f^n x$$

$$= \lambda f x. \underbrace{f(f(\dots(f x) \dots))}_{x}$$

Church numerals

Definition

For every $n \in \mathbb{N}$, the Church numeral $\lceil n \rceil$ for n is defined by:

Examples.

$$\lceil 0 \rceil = \lambda f x. x$$

$$\lceil 1 \rceil = \lambda f x. f x$$

$$\lceil 2 \rceil = \lambda f x. f(fx)$$
...

Pairs in λ -calculus

Definition

For all $M, N \in \Lambda$ we define the pair (M, N) consisting of M and N:

$$\langle M, N \rangle := \lambda x. xMN$$

and the unpairing projections ρ_1 and ρ_2 :

$$\rho_1 := \lambda p.p(\lambda xy.x)$$

$$\rho_2 \coloneqq \lambda p. p(\lambda xy. y)$$

Proposition

For all $M_1, M_2 \in \Lambda$ and i = 1, 2:

$$\rho_i\langle M_1, M_2\rangle \twoheadrightarrow_\beta M_i$$

True, false, if-then-else, **zero?** in λ -calculus

Definition

$$\mathbf{true} \coloneqq \lambda xy.x$$

$$\mathbf{false} \coloneqq \lambda xy.y$$

$$\mathbf{if}\ P\ \mathbf{then}\ Q\ \mathbf{else}\ R \coloneqq PQR$$

$$\mathbf{zero?} \coloneqq \lambda x.x(\lambda y.\mathbf{false})\mathbf{true}$$

Proposition

if true then
$$Q$$
 else $R \twoheadrightarrow_{\beta} Q$
if false then Q else $R \twoheadrightarrow_{\beta} R$
zero? $\lceil 0 \rceil \twoheadrightarrow_{\beta} true$
zero? $\lceil n + 1 \rceil \twoheadrightarrow_{\beta} false$

λ -definable functions

Definition

▶ Let $f: \mathbb{N}^n \to \mathbb{N}$ be total.

A λ -term M_f represents f if for all $m_1, \ldots, m_k \in \mathbb{N}$:

$$M_f \lceil m_1 \rceil \dots \lceil m_n \rceil \twoheadrightarrow_{\beta} \lceil f(m_1, \dots, m_n) \rceil$$

f is λ -definable if there exists a λ -term that represents f.

λ -definable functions

Definition

▶ Let $f: \mathbb{N}^n \to \mathbb{N}$ be total. A λ -term M_f represents f if for all $m_1, \ldots, m_k \in \mathbb{N}$:

$$M_f$$
 $\lceil m_1 \rceil \dots \lceil m_n \rceil \twoheadrightarrow_{\beta} \lceil f(m_1, \dots, m_n) \rceil$

f is λ -definable if there exists a λ -term that represents f.

▶ Let $f: \mathbb{N}^n \to \mathbb{N}$ be a partial function.

A λ -term M_f represents f if for all $m_1, \ldots, m_n \in \mathbb{N}$:

$$f(m_1, \dots, m_n) \downarrow \implies M_f \lceil m_1 \rceil \dots \lceil m_n \rceil \twoheadrightarrow_{\beta} \lceil f(m_1, \dots, m_n) \rceil$$

 $f(m_1, \dots, m_n) \uparrow \implies M_f \lceil m_1 \rceil \dots \lceil m_n \rceil$ has no normal form

f is λ -definable if there exists a λ -term that represents f.

λ -definable

Examples.

- ▶ SUCCESSOT: $M_{\text{succ}} \coloneqq \lambda nfx.f(nfx)$
- ▶ addition: $M_+ := \lambda mnfx.mf(nfx)$
- ▶ multiplication: $M_{\times} := \lambda mnfx.m(nf)x$
- exponentiation: $M_E := \lambda mnfx.mnfx$
- ▶ projection function: $M_{\pi_i^k} = \lambda n_1 \dots n_k . n_i$

The Book

(reference [1]) Hendrik Pieter (Henk) Barendregt

Exercises

- (1) Describe all possible ways to reduce $(\lambda xy.x)((\lambda x.xx)(\lambda x.xx))$ to normal form.
- (2) Find two distinct λ -terms representing the successor function on Church-numerals (hint: think of n+1 and 1+n). Prove that your λ -terms are not- β -equivalent.
- (3) Try computing the normal form of the Y-combinator, i.e. of AA where $A = \lambda am.m(aam)$, e.g. by each time selecting the leftmost redex (reducible expression, i.e. subexpression of the shape $(\lambda x.M)N$).

Primitive recursive functions are λ -definable

Proposition

Every primitive recursive function is λ -definable.

Primitive recursive functions are λ -definable

Proposition

Every primitive recursive function is λ -definable.

Proof (The case of primitive recursion).

Let $h := \operatorname{pr}(f;g) : \mathbb{N}^{n+1} \to \mathbb{N}$ for prim.rec. $f : \mathbb{N}^n \to \mathbb{N}$, $g : \mathbb{N}^{n+2} \to \mathbb{N}$:

$$h(\vec{x}, 0) = f(\vec{x})$$

$$h(\vec{x}, y + 1) = g(\vec{x}, h(\vec{x}, y), y)$$

Suppose that f and g are represented by $M_f, M_g \in \Lambda$, respectively.

Primitive recursive functions are λ -definable

Proposition

Every primitive recursive function is λ -definable.

Proof (The case of primitive recursion).

Let $h := \operatorname{pr}(f;g) : \mathbb{N}^{n+1} \to \mathbb{N}$ for prim.rec. $f : \mathbb{N}^n \to \mathbb{N}$, $g : \mathbb{N}^{n+2} \to \mathbb{N}$:

$$h(\vec{x}, 0) = f(\vec{x})$$

$$h(\vec{x}, y + 1) = g(\vec{x}, h(\vec{x}, y), y)$$

Suppose that f and g are represented by $M_f, M_g \in \Lambda$, respectively.

Init :=
$$\langle {}^{\mathsf{r}}0{}^{\mathsf{r}}, M_f x_1 \dots x_n \rangle$$

Step := $\lambda p. \langle M_{\mathsf{succ}}(\rho_1 p), M_q x_1 \dots x_n(\rho_2 p)(\rho_1 p) \rangle$

Then the following λ -term M_h represents h:

$$M_h := \lambda x_1 \dots x_n x \cdot \rho_2(x \text{ Step Init})$$

Primitive recursive functions ($\mathbb{N}^n \cup \mathbb{N}^0 \to \mathbb{N}$)

Base functions:

- \triangleright $\mathcal{O}: \mathbb{N}^0 = \{\emptyset\} \rightarrow \mathbb{N}, \emptyset \mapsto 0$ (0-ary constant-0 function)
- ▶ succ : $\mathbb{N} \to \mathbb{N}$, $x \mapsto x + 1$ (successor function)
- $\mathbf{x}_{i}^{n}: \mathbb{N}^{n} \to \mathbb{N}, \vec{x} = \langle x_{1}, \dots, x_{n} \rangle \mapsto x_{i} \text{ (projection function)}$

Closed under operations:

▶ composition: if $f: \mathbb{N}^k \to \mathbb{N}$, and $g_i: \mathbb{N}^n \to \mathbb{N}$ are prim. rec., then so is $h = f \circ (g_1 \times \ldots \times g_k) : \mathbb{N}^n \to \mathbb{N}$:

$$\mathbf{h}(\vec{x}) = f(g_1(\vec{x}), \dots, g_k(\vec{x}))$$

▶ primitive recursion: if $f: \mathbb{N}^n \to \mathbb{N}$, $g: \mathbb{N}^{n+2} \to \mathbb{N}$ are prim. rec., then so is $h = \operatorname{pr}(f;g): \mathbb{N}^{n+1} \to \mathbb{N}$:

$$h(\vec{x},0) = f(\vec{x})$$
$$h(\vec{x},y+1) = g(\vec{x},h(\vec{x},y),y)$$

μ -recursion, and partial recursive functions

Definition

A partial function $f: \mathbb{N}^n \to \mathbb{N}$ is called partial recursive if it can be specified from base functions $(\mathcal{O}, \mathsf{succ}, \pi_i^n)$ by successive applications of composition, primitive recursion, and unbounded minimisation.

A partial recursive function is called (total) recursive if it is total.

μ -recursion, and partial recursive functions

Definition

A partial function $f: \mathbb{N}^n \to \mathbb{N}$ is called partial recursive if it can be specified from base functions $(\mathcal{O}, \mathsf{succ}, \pi_i^n)$ by successive applications of composition, primitive recursion, and unbounded minimisation.

A partial recursive function is called (total) recursive if it is total.

Let $f: \mathbb{N}^{n+1} \to \mathbb{N}$ total. Then the partial function defined by:

$$\mu(f): \mathbb{N}^n \to \mathbb{N}$$

$$\vec{x} \mapsto \begin{cases} \min(\{y \mid f(\vec{x}, y) = 0\}) & \dots \exists y (f(\vec{x}, y) = 0) \\ \uparrow & \dots \text{ else} \end{cases}$$

is called the unbounded minimisation of f.

μ -recursion, and partial recursive functions

Definition

A partial function $f: \mathbb{N}^n \to \mathbb{N}$ is called partial recursive if it can be specified from base functions $(\mathcal{O}, \mathsf{succ}, \pi_i^n)$ by successive applications of composition, primitive recursion, and unbounded minimisation.

A partial recursive function is called (total) recursive if it is total.

Let $f: \mathbb{N}^{n+1} \to \mathbb{N}$ partial. Then the partial function $\mu(f)$:

$$\mu(f): \mathbb{N}^n \to \mathbb{N}$$

$$\vec{x} \mapsto \begin{cases} \uparrow & \dots \neg \exists y \left(\land f(\vec{x}, y) = 0 \forall z \left(0 \le z < y \to (f(\vec{x}, z) \downarrow) \right) \\ z & \dots \land f(\vec{x}, z) = 0 \forall y \ 0 \le y < z \to (f(\vec{x}, y) \downarrow \neq 0) \end{cases}$$

is called the unbounded minimisation of f.

 $\textit{course} \quad \textit{ov} \quad \lambda \textit{-terms} \quad \beta \textit{-red.} \quad \textit{C-num's} \quad \lambda \textit{-def.} \quad \textit{feat's} \quad \textit{book} \quad \textit{ex} \quad \textit{prim.rec.} \Rightarrow \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \quad \lambda \textit{-def.} \quad \lambda \textit{-def.} \quad \textit{su} \quad \textit{reading} \quad \textit{course} \quad \textit{refs} \quad \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \Rightarrow \lambda$

Reminder: Kleene's normal form theorem

Theorem

For every partial recursive function $h: \mathbb{N}^n \to \mathbb{N}$ there exist primitive recursive functions $f: \mathbb{N} \to \mathbb{N}$ and $g: \mathbb{N}^{n+1} \to \mathbb{N}$ such that:

$$h(x_1,\ldots,x_n)=(f\circ\mu(g))(x_1,\ldots,x_n)$$

 $\textit{course} \quad \textit{ov} \quad \lambda \textit{-terms} \quad \beta \textit{-red.} \quad \textit{C-num's} \quad \lambda \textit{-def.} \quad \textit{feat's} \quad \textit{book} \quad \textit{ex} \quad \textit{prim.rec.} \Rightarrow \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \quad \lambda \textit{-def.} \Rightarrow \textit{T-comp.} \quad \textit{su} \quad \textit{reading} \quad \textit{course} \quad \textit{refs} \quad \textit{refs$

μ -recursive/partial recursive $\Rightarrow \lambda$ -definable

Theorem

Every μ -recursive/partial recursive function is λ -definable.

Proof.

Let $h : \mathbb{N}^{n+1} \to \mathbb{N}$ be partial recursive.

 $\textit{course} \quad \textit{ov} \quad \lambda \textit{-terms} \quad \beta \textit{-red}. \quad \textit{C-num's} \quad \lambda \textit{-def.} \quad \textit{feat's} \quad \textit{book} \quad \textit{ex} \quad \textit{prim.rec.} \Rightarrow \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \quad \lambda \textit{-def.} \quad \Rightarrow \textit{T-comp.} \quad \textit{su} \quad \textit{reading} \quad \textit{course} \quad \textit{refs} \quad \textit{refs} \quad \textit{course} \quad \textit{course} \quad \textit{refs} \quad \textit{course} \quad \textit{course$

μ -recursive/partial recursive $\Rightarrow \lambda$ -definable

Theorem

Every μ -recursive/partial recursive function is λ -definable.

Proof.

Let $h: \mathbb{N}^{n+1} \to \mathbb{N}$ be partial recursive.

Then by Kleene's normal form theorem there exist $g: \mathbb{N}^{n+1} \to \mathbb{N}$ and $f: \mathbb{N} \to \mathbb{N}$ such that:

$$h(\vec{x}) = f \circ \mu(g)(\vec{x}) = f(\mu z.[g(\vec{x}, z) = 0])$$

μ -recursive/partial recursive $\Rightarrow \lambda$ -definable

Theorem

Every μ -recursive/partial recursive function is λ -definable.

Proof.

Let $h: \mathbb{N}^{n+1} \to \mathbb{N}$ be partial recursive.

Then by Kleene's normal form theorem there exist $g: \mathbb{N}^{n+1} \to \mathbb{N}$ and $f: \mathbb{N} \to \mathbb{N}$ such that:

$$h(\vec{x}) = f \circ \mu(g)(\vec{x}) = f(\mu z.[g(\vec{x}, z) = 0])$$

Let M_f and M_g be λ -terms representing f and g, respectively. Let:

$$W \coloneqq \lambda y.$$
 if (zero? $M_g x_1...x_n y$) then $(\lambda w.M_f y)$ else $(\lambda w.w(M_{\text{succ}}y)w)$

Then the following λ -term M_h represents h:

$$M_h := \lambda x_1 \dots x_n . W \circ 0 W$$

A normalizing reduction strategy

Normal order reduction strategy $\stackrel{n}{\rightarrow}$: only perform \rightarrow_{β} -steps in left-most positions.

A normalizing reduction strategy

Normal order reduction strategy $\stackrel{\text{n}}{\rightarrow}$: only perform \rightarrow_{β} -steps in left-most positions.

Theorem

The normal order reduction strategy in is normalizing in λ -calculus, that is:

$$M \twoheadrightarrow_{\beta} N \wedge N$$
 is a normal form $\implies M \stackrel{n}{\twoheadrightarrow} N$

λ -definable \Rightarrow Turing-computable

Theorem

Every λ -definable function is Turing computable.

 $\textit{course} \quad \textit{ov} \quad \lambda \textit{-terms} \quad \beta \textit{-red.} \quad \textit{C-num's} \quad \lambda \textit{-def.} \quad \textit{feat's} \quad \textit{book} \quad \textit{ex} \quad \textit{prim.rec.} \Rightarrow \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \quad \lambda \textit{-def.} \quad \lambda \textit{-def.} \quad \textit{su} \quad \textit{reading} \quad \textit{course} \quad \textit{refs} \quad \lambda \textit{-def.} \quad \textit{part.rec.} \Rightarrow \lambda \textit{-def.} \Rightarrow \lambda$

λ -definable \Rightarrow Turing-computable

Theorem

Every λ -definable function is Turing computable.

Idea of the Proof.

Let $f: \mathbb{N}^n \to \mathbb{N}$ be a partial function that is λ -definable. Then there exists a λ -term M_f that represents f.

λ -definable \Rightarrow Turing-computable

Theorem

Every λ -definable function is Turing computable.

Idea of the Proof.

Let $f: \mathbb{N}^n \to \mathbb{N}$ be a partial function that is λ -definable. Then there exists a λ -term M_f that represents f.

To compute f, one can build a Turing machine M that, for given $m_1, \ldots, m_n \in \mathbb{N}$:

▶ simulates a normal order rewrite sequence on M_f $\lceil m_1 \rceil ... \lceil m_n \rceil$

λ -definable \Rightarrow Turing-computable

Theorem

Every λ -definable function is Turing computable.

Idea of the Proof.

Let $f: \mathbb{N}^n \to \mathbb{N}$ be a partial function that is λ -definable. Then there exists a λ -term M_f that represents f.

To compute f, one can build a Turing machine M that, for given $m_1, \ldots, m_n \in \mathbb{N}$:

▶ simulates a normal order rewrite sequence on M_f $\lceil m_1 \rceil \dots \lceil m_n \rceil$ to obtain the normal form $\lceil f(m_1, \dots, m_n) \rceil$

Summary

Lambda calculus

- λ-calculus
 - syntax
 - reduction rules
- λ-definable functions
- primitive recursive functions are λ -definable
- μ -recursive/partial recursive functions are λ -definable
- \triangleright λ -definable functions are Turing computable
- ▶ Hence: λ -definable = partial recursive = Turing-computable

Course overview

Monday, July 7 10.30 – 12.30	Tuesday, July 8 10.30 – 12.30	Wednesday, July 9 10.30 – 12.30	Thursday, July 10 10.30 – 12.30	Friday, July 11
intro	classic models			additional models
Introduction to Computability	Machine Models	Recursive Functions	Lambda Calculus	
computation and decision problems, from logic to computability, overview of models of computation relevance of MoCs	Post Machines, typical features, Turing's analysis of human computers, Turing machines, basic recursion theory	primitive recursive functions, Gödel-Herbrand recursive functions, partial recursive funct's, partial recursive = = Turing-computable, Church's Thesis	λ -terms, β -reduction, λ -definable functions, partial recursive = λ -definable = Turing computable	
	imperative programming	algebraic programming	functional programming	
				14.30 – 16.30
				Three more Models of Computation
				Post's Correspondence Problem, Interaction-Nets, Fractran comparing computational power
